The aim of this study was to investigate the impact of aeration rate on the composition and physical-chemical parameters of wastewater before and after anaerobic biodegradation. The results demonstrated that a low aeration rate ($p = 1.2$ mbar) leads to lower treatment capacity, but to lower sludge production. This inhibition of biodegradation of organic matters, which is mainly due to lower oxygen availability in the wastewater, can be restored by increasing the aerobic sludge production. This recovery however, results from the inoculum recycling process, and not from the presence of a self-growing surface layer of activated sludge.Q: In Grails, how can I use rest as a block?
